

IT MANAGED SECURITY OFFERINGS

61%

... of organizations have experienced a security incident. Don't wait until it's too late to take action. To help clients understand and manage their own security exposure or compliance requirements, we are now offering the following security services.

MICROSOFT AZURE ASSESSMENT

Microsoft Azure is an ever-expanding set of cloud services with features and security enhancements added regularly. These features are not automatically provisioned and are often misconfigured. Our MS Azure Assessment will inspect your Azure environment to determine which enhancements or existing offerings will benefit your environment.

MICROSOFT 365 ASSESSMENT

Microsoft apps are the most heavily used productivity tools by employees in today's business world. This is also a place where human-error commonly occurs, leading to security breaches and data loss. This assessment will examine your Microsoft 365 environment to provide security enhancement recommendations to protect your organization against threats and breaches.

INTERNAL NETWORK ASSESSMENT

For the IT department that may be struggling to stay on top of every day needs, our Internal Network Assessment serves as a useful tool to help with documentation and identifies security vulnerabilities, misconfigurations, and anomalies that need to be addressed (e.g. exposed credentials, missing security patches, out of date, or end of life operating systems).

58%

... of users accidentally share sensitive information

SIMULATED PHISHING CAMPAIGN

Phishing attacks account for up to 90% of corporate data breaches. Simulated phishing campaigns educate your staff and prepare them for this type of threat and can considerably lessen the likelihood of successful phishing attacks in the future. Problematic staff can be disciplined or re-tested until they properly identify threats.

VULNERABILITY ASSESSMENT

HIPAA, PCI, and other compliance requirements rely on vulnerability assessment reports to gauge a company's preparedness and adherence. Our systems scan your external network to simulate the role of an unauthenticated hacker attempting to exploit your network and produce a detailed report of findings with recommended actions.
